Manual textual annotation : a tiring task

The Government warns of the presence of African psylla in Cantabria with an outbreak in Mogro.

The Regional Ministry of Rural Development has warned about the presence in Cantabria of Psila Africana de los Cítricos (*Trioza erytreae*), an insect of sub-Saharan origin that affects lemon, orange, mandarin and other citrus trees, and whose first outbreak in the region has been detected in Miengo.

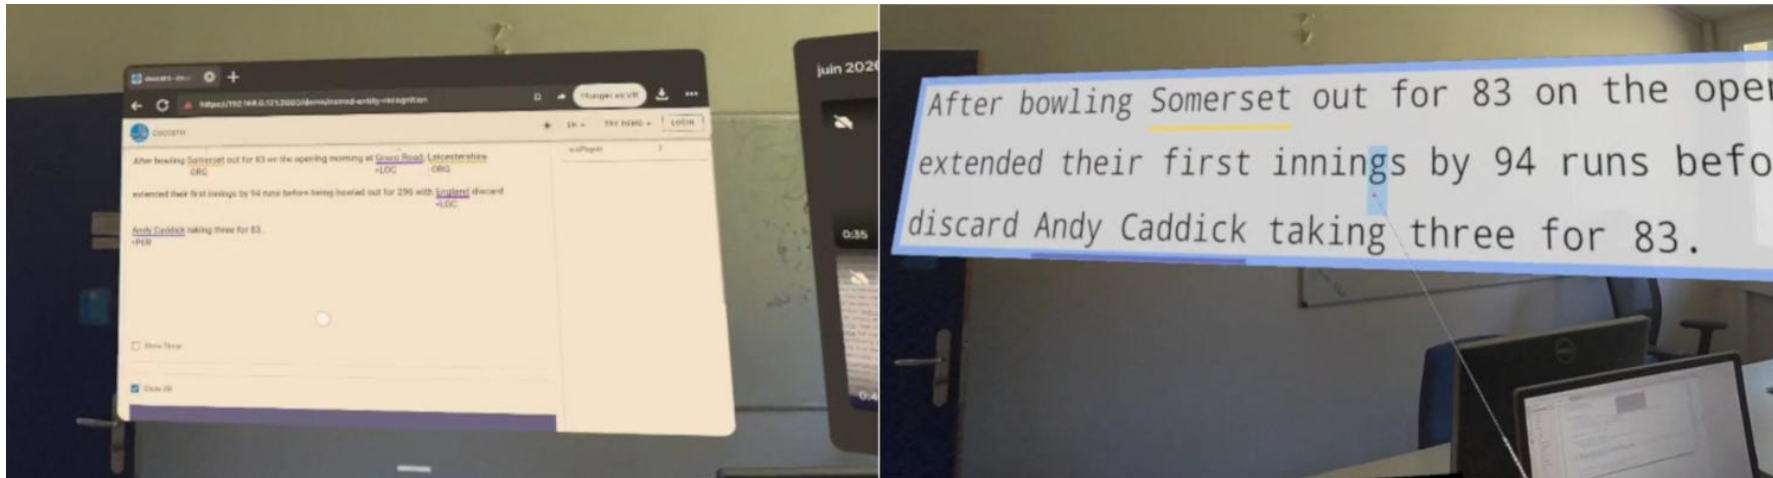

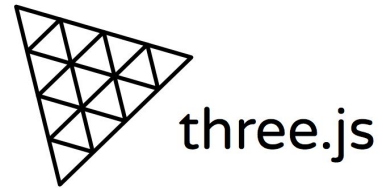

Detected in the Canary Islands in 2002 and in Galicia and northern Portugal in 2014, this is a quarantine pest regulated in the European Union and represents an important vector of the bacteria that causes Huanglongbing (HLB) or citrus greening (Greening). This sucking insect can cause the deterioration of the quality and taste of the fruit, even causing the death of the affected tree in a few years, informed this Monday the regional government in a press release. In order to eradicate this first outbreak and avoid its dispersion, the Government of Cantabria will inspect the affected area and its surroundings to delimit its extension and will destroy the affected shoots to later burn them or bury them in depth.
